The Windows 10 interface, while functional in design, can nevertheless get a bit stale after a while. It's certainly attractive enough to not warrant an immediate alteration upon first glance, but users can afford to try and they are very much allowed to do so. If the Windows 11 aesthetic happens to interest you, using a program to change the cosmetics a bit can be worth a shot. RoundedTB is such an app, rounding the taskbars of your Windows 10 machine to make it fall more in line with the next iteration's aesthetic. Rounded taskbars If you are looking to get away from the squared, boxy design of Windows 10, Rounded TB can adjust that to your liking. It's a barebones app that features two options and an "Apply" button, and that's all there is to it. Changing the "Margin" number reduces your taskbar's margins, while the changes to "Corner radius" round the taskbar. Too high of a number on the former cuts into your taskbar, and the same is true for the latter. A little hiccup RoundedTB certainly does what it is supposed to do, but its manner of operation still has some room for improvement. Field of the Invention The present invention relates to a method and an apparatus for inspecting objects, and more particularly, it relates to a method and an apparatus for inspecting defects in objects such as semiconductor wafers. 2. Description of the Related Art In recent years, the miniaturization of semiconductor devices has made it possible to produce finer patterns in patterns of semiconductor devices such as semiconductor memory devices (DRAM, SRAM, flash memory, and so on) and large-scale integrated circuits (LSI) which include such semiconductor devices. This miniaturization of patterns has necessitated a mechanism for inspecting defects in objects such as semiconductor wafers during the step of manufacturing semiconductor devices. An example of a conventional apparatus for inspecting defects in objects is described in Japanese Laid-Open Patent Application No. 4-237619. This inspection apparatus is provided with a table to which an object such as a semiconductor wafer (hereinafter, simply referred to as a wafer) is secured, a plurality of illumination means disposed at different angles and mounted on a moveable stage, and a plurality of inspection means disposed in an illumination space defined between the wafer and the

Bioanalysis is the most significant and fastest growing application of affinity chromatography in the pharmaceutical industry. The drug's efficacy could be dramatically enhanced when a proper dose of the drug is achieved. Therefore, there is a clear motivation for the development of bioanalysis systems that are capable of determining the drug's concentration. The currently available bioanalytical methods require a large sample volume (milliliters or more), highly skilled personnel to perform the assay, and high levels of instrumentation and costs. The most common in vitro bioanalysis techniques, the high pressure liquid chromatographic (HPLC) and the gas chromatographic (GC) techniques, provide an excellent sensitivity. However, there are some drawbacks related to these conventional bioanalysis techniques, such as the requirement for the use of excessive amounts of biological samples, the difficulty of retaining proteins/peptides for further chemical analysis and sample preparation, and high costs in terms of apparatus and reagents. In spite of all these drawbacks, for the traditional bioanalytical methods, it is suggested that, there is a need for a device and a method that can allow the evaluation and control of the medical therapy for a patient as soon as the medical therapy is started.Anuj Dhanani Anuj Dhan
